needed animals in the world.

It is clearly and distinctly established that Tibet, for example, could never exist and people could never live in that part of the world if it weren't for the yaks and yaks are native only to that part of the world —yes, wild ones, I mean. That's where they were originally found and tamed. They still roam wild on some of the higher inaccessible elevations and plateaus in that part of the globe.

No one will attempt to deny that our cow is a most useful and practically essential animal. It gives milk from which we make butter, cheese and cream. We use the carcass for meat and the hide for shoes, baseballs and many other articles but, to the best of my knowledge and belief, the cow as it is today actually couldn't look after herself in the northern latitudes and pasture food must be provided.

Well, the yak does everything a cow does. Besides that, it is one of the finest beasts of burden. Then, too, it is the surest-footed animal to be found anywhere. It can, and often does, forage for its own food. It can live off practically nothing. It is suspected that it can find sustenance in a bit of grass or roots or even a bit of coarse, uninviting (to any other animal) herbage.

Like our cow, it takes to domestication readily. Both the Tibetans and the Hunzans use them to work their fields and flail their wheat, barley and other grains. From the wool on its back, belly and head comes the toughest of woven fabrics, from which is made the sturdiest of clothes for the people and tents for their homes. Wherever you see rope in Hunza, you can be sure that it was made from braided or woven yak hair.

The hide is used for most everything . . . boots and shoes, of course, and water containers and skin boats, which are the means and mode of transportation across and up and down the dangerous rivers
